6	7 10:00am 15.769lec; E62-223 2:00pm Golf 6:00pm SDM Mixer; Mead Hall; Justin Yoon	8 1:00pm SCM.270lec; E51-325	9 10:00am 15.769lec; E62-223 2:00pm Golf 7:30pm Mass	10 2:00pm Darryl Yau weekly meeting; E40-255; Chris Caplice	11 4:00pm Personal Stories; E40 SCM Lab; Justin Yoon	12 Tim's Wedding 7:00am Meet at Jackys
13	14 10:00am 15.769lec; E62-223 2:00pm Golf 4:30pm Canceled: SCM Staff Sync; E90 Corner; Justin Yoon 5:00pm GSC Coffee Hour; Forbes Cafe (Stata Center 1st Floor)	15 12:00pm SCM Photo; Killian Court 1:00pm SCM.270lec; E51-325	16 10:00am 15.769lec; E62-223 2:00pm Golf 3:00pm Solve at MIT; Kresge	17 4:30pm Personal Stories; E40 SCM Lab; Justin Yoon	18 4:00pm Acoustic BBQ; Stata Amphitheater	19
20	21 10:00am 15.769lec; E62-223 2:00pm Golf	22 8:00am Research Fest 1:00pm SCM.270lec; E51-325	23 10:00am 15.769lec; E62-223 2:00pm Golf	24 10:00am Incoming Students Webinar; CTL: E40-353 - Sm Conf - seat 18; Aren Ghazarians 6:00pm Graduate Student Spring Pub Night 5/24 @ 6pm; Morss Hall	25 5:00pm SP BBQ; MP Room	26
27	28 Memorial Day 4:30pm Canceled: SCM Staff Sync; E90 Corner; Justin Yoon	29	30	31	Jun 1	2

- Always at my meetings
- 100% adherence to schedule
- 100% On Time Delivery (OTD)

Supply Chain Example

BUT... 100% adherence to schedule within the supply chain context is almost unheard of

Period	0	1	2	3	4
Demand	50	100	50	50	100
Production Plan	50	100	50	50	100
Actual Production	40	90	80	20	120
	-10	-20	+10	-20	0

Supply Chain is very **complex!**

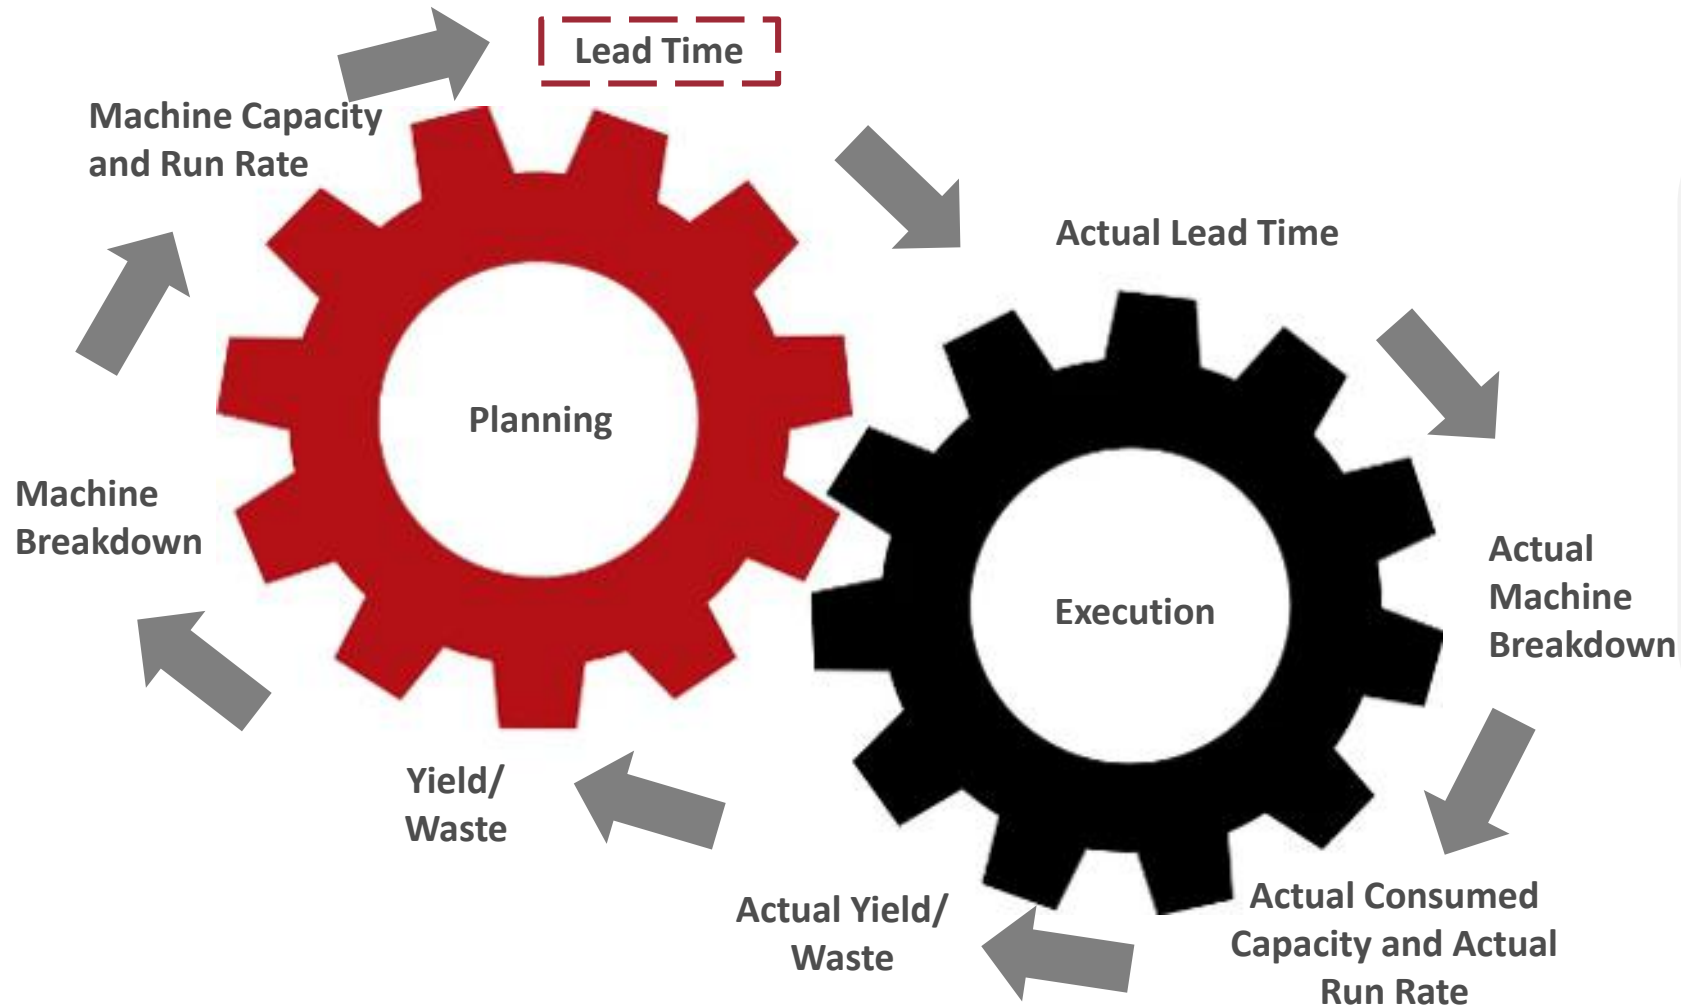

What can we do?

Force operations to conform to the schedule

Create a schedule that is more accurate

Many parameters used during planning process are not given the proper attention it deserves

Consider:

- Values that were not scientifically or accurately set in the first place
- Values that have changed or are changing over time

How do we create a 'self-healing' supply chain?

Improving Supply Chain Planning with Advanced Analytics

Analyzing Lead Time as a Case Study

1

**Baseline Current State**

To what extent are the lead time variables found in the Enterprise Resource Planning (ERP) system are used in predicting lead time and how accurate is the prediction?

2

**Propose Improved Future State**

Can predictive analytics on historical lead time data be used to improve the forecast accuracy and what are the benefits in doing so?

Today's Agenda

Regression Performed Across the Entire Dataset

Background

Data

Analysis and Results

Conclusion

LT_v and LT_p
vs.
Planned Lead Time

LT_v and LT_p
vs.
Actual Lead Time

	Dependent Variable	Intercept (β_0)	SKU and Vendor (LT_v) (β_1)	SKU and Plant (LT_p) (β_2)	Adjusted R^2
All	Planned Lead Time	7.086	0.064	0.853	0.253
	Actual Lead Time	7.953	0.224	0.718	0.155
2004-2007	Planned Lead Time	15.827	-0.340	0.051	0.007
	Actual Lead Time	86.269	-2.666	0.049	0.005
2008-2011	Planned Lead Time	20.798	-0.236	0.328	0.032
	Actual Lead Time	73.426	-1.445	0.376	0.014
2012-2015	Planned Lead Time	7.314	0.089	0.909	0.266
	Actual Lead Time	7.042	0.221	0.811	0.204
2016-2017	Planned Lead Time	5.661	0.073	1.122	0.406
	Actual Lead Time	7.537	0.191	0.879	0.249

- Poor R^2 values
- Seems to improve over time
- R^2 values for Actual Lead Time consistently worse than R^2 for Planned Lead Time

Vendor and Plant appears to be factors contributing to the variability of actual lead time

Background

Data

Analysis and Results

Conclusion

Colored by Vendor

Colored by Plant

Note: Using one SKU as an example

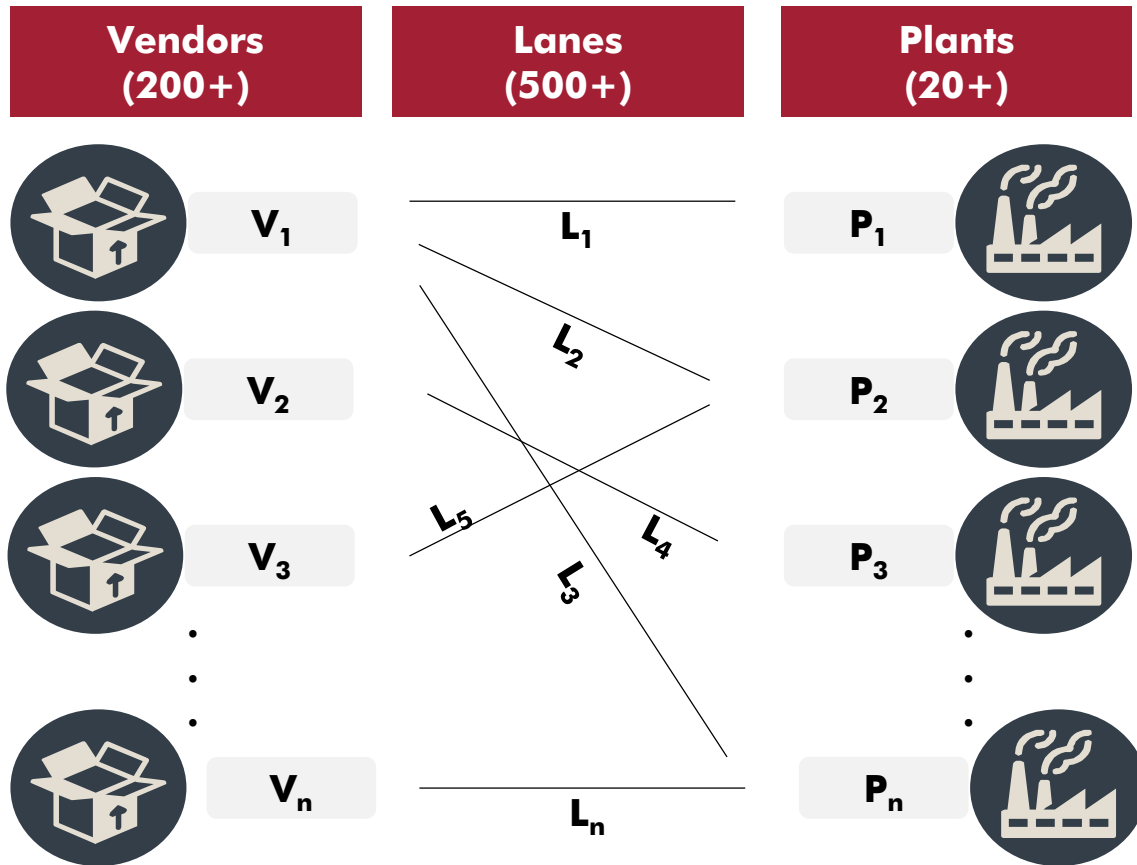

Analyses performed at the SKU–Lane level

Background

Data

Analysis and Results

Conclusion

Lane = Unique Vendor and Plant Combination

Test — Null Hypothesis: Are these datasets statistically the same?

Background

Data

Analysis and Results

Conclusion

P Values of *T* Tests for LTV vs. Planned Lead Time

P Values of *T* Tests for LTP vs Planned Lead Time

P Values of *T* Tests for Planned Lead Time vs. Actual Lead Time

- Ran *t* test on over 25,000 SKU-Lanes
 - For LTV and Planned Lead Time
 - For LTP and Planned Lead Time
 - Planned Lead Time and Actual Lead Time
- NOT the same for all tests

Improving Supply Chain Planning with Advanced Analytics

Analyzing Lead Time as a Case Study

Background

Data

Analysis and Results

Conclusion

1

Baseline Current State

To what extent are the lead time variables found in the Enterprise Resource Planning (ERP) system are used in predicting lead time and how accurate is the prediction?

2

The standard lead time variables (LTv and LTp) are **not** good predictors for what is planned

The planned lead times are **not** good predictors for what actually happens

Can predictive analytics on historical lead time data be used to improve the forecast accuracy and what are the benefits in doing so?

Can predictive analytics on historical lead time data be used to improve the forecast accuracy and what are the benefits in doing so?

Time Series Analysis — Forecasting Methods

Background

Data

Analysis and Results

Conclusion

Method	Description	Equation
Method 1 – Naïve	Only the last data point is considered.	$\hat{x}_{t,t+1} = x_t$
Method 2 – Simple Mean	All the data points are considered. Any trend in the underlying data will lead to severe lagging.	$\hat{x}_{t,t+1} = \frac{\sum_i^t x_i}{t}$
Method 3 – Moving Average	Only the last n data points are considered.	$\hat{x}_{t,t+1} = \frac{\sum_{i=t+1-n}^t x_i}{n}$
Method 4 – Single Exponential Smoothing	This model is used to capture level of the time series. However, data is treated differently depending on its age.	$\hat{x}_{t,t+1} = \alpha x_t + (1 - \alpha)\hat{x}_{t-1,t}$
Method 5 – Holt's Method (level and trend)	This model is used to forecast time series with a linear trend. A form of exponential smoothing, a higher weight is given to data that is more recent.	$\hat{x}_{t,t+\tau} = \hat{a}_t + \tau \hat{b}_t$ $\hat{a}_t = \alpha x_t + (1 - \alpha)(\hat{a}_{t-1} + \hat{b}_{t-1})$ $\hat{b}_t = \beta(\hat{a}_t - \hat{a}_{t-1}) + (1 - \beta)\hat{b}_{t-1}$
Method 6 – Holt-Winter's Method (level, trend, and seasonality)	Model is used to forecast time series with both a linear trend and seasonality. A form of exponential smoothing, a higher weight is given to data that is more recent.	$\hat{x}_{t,t+\tau} = \hat{a}_t + \tau \hat{b}_t + \hat{F}_{t+\tau-P}$ $\hat{a}_t = \alpha \left(\frac{x_t}{\hat{F}_{t-P}} \right) + (1 - \alpha)(\hat{a}_{t-1} + \hat{b}_{t-1})$ $\hat{b}_t = \beta(\hat{a}_t - \hat{a}_{t-1}) + (1 - \beta)\hat{b}_{t-1}$ $\hat{F}_t = \gamma \left(\frac{x_t}{\hat{a}_t} \right) + (1 - \gamma)\hat{F}_{t-P}$

	Mean (Days)	Coefficient of Variation	Standard Deviation (Days)	Mean Deviation (MD) (Days)	Mean Average Deviation (MAD) (Days)	Mean Absolute Percent Error (MAPE)	Root Mean Squared Error (RMSE) (Days)	Mean Percent Error (MPE)
Baseline 1: Planned Lead Time	9.23	0.49	4.56	-1.34	1.40	18.45%	1.85	-17.71%
Baseline 2: Regression Analysis	8.98	0.00	0.00	-1.09	3.21	46.42%	3.84	-32.99%
Naïve Approach	8.13	0.50	4.05	-0.24	1.29	24.12%	2.81	-10.29%
Simple Mean Approach	8.00	0.01	0.04	-0.11	2.63	34.88%	3.70	-18.58%
Moving Average (n=5)	8.81	0.45	4.00	-0.93	2.45	44.73%	3.96	-27.59%
Moving Average (n=10)	9.34	0.34	3.16	-1.45	3.40	56.61%	4.62	-40.09%
Simple Exponential Smoothing ($\alpha = 0.1$)	9.53	0.20	1.93	-1.64	3.28	52.86%	3.93	-40.89%
Holt's Method ($\alpha = 0.2 \beta=0.05$)	9.13	0.39	3.55	-1.24	2.59	45.94%	4.08	-33.51%
Holt-Winter's Method ($\alpha = 0.2 \beta=0.05 \gamma=0.1$)	8.66	0.36	3.12	-0.77	2.21	37.33%	3.00	-22.62%

Bottom-up and Top-down Analyses

Background

Data

Analysis and Results

Conclusion

Analysis of Entire Dataset

Background

Data

Analysis and Results

Conclusion

Mean MAPE of Forecast Methods vs. the Baselines

- Ran for over 2,500 SKU-Lane Combinations
- Best Forecast Method had a lower average MAPE than both baselines
- Using a single method had a lower average MAPE than both baselines

Which had the Lower RMSE Result? (Forecast Method vs Baselines)

- Best Forecast Method, on average, performed better than both baselines

Which Forecast Method?

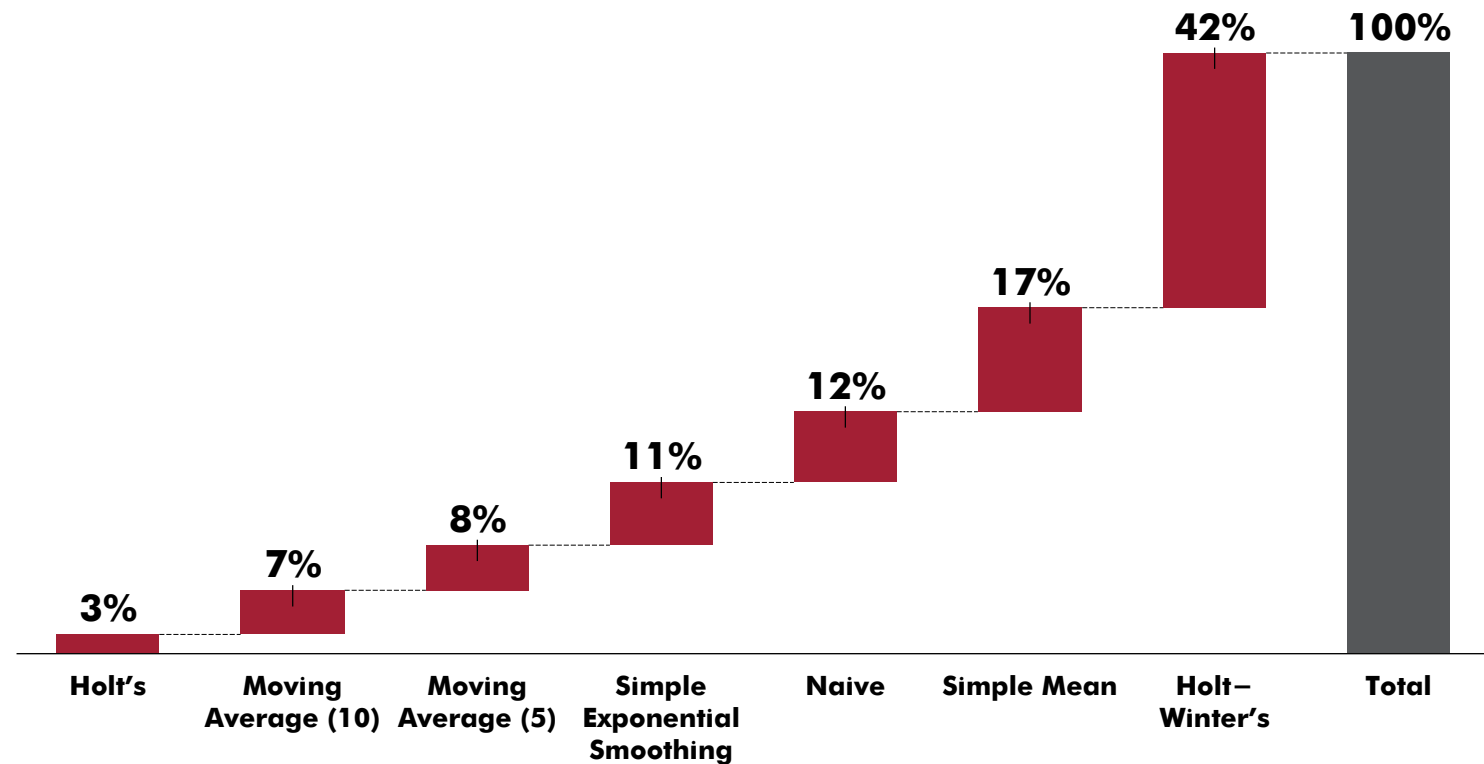

Background

Data

Analysis and Results

Conclusion

Forecast Method with the Lowest RMSE Value (gaps not filled)

- Holt-Winter's Method regularly performed better than other methods
- Holt's Method regularly performed worse than other methods

Trend did not appear to be a big factor in this dataset

Background

Data

Analysis and Results

Conclusion

Of the **five** SKU-Lanes that may have a trend in the data, only 1 appeared to have a significant trend.

*Based on Dickey-Fuller Test for Stationarity

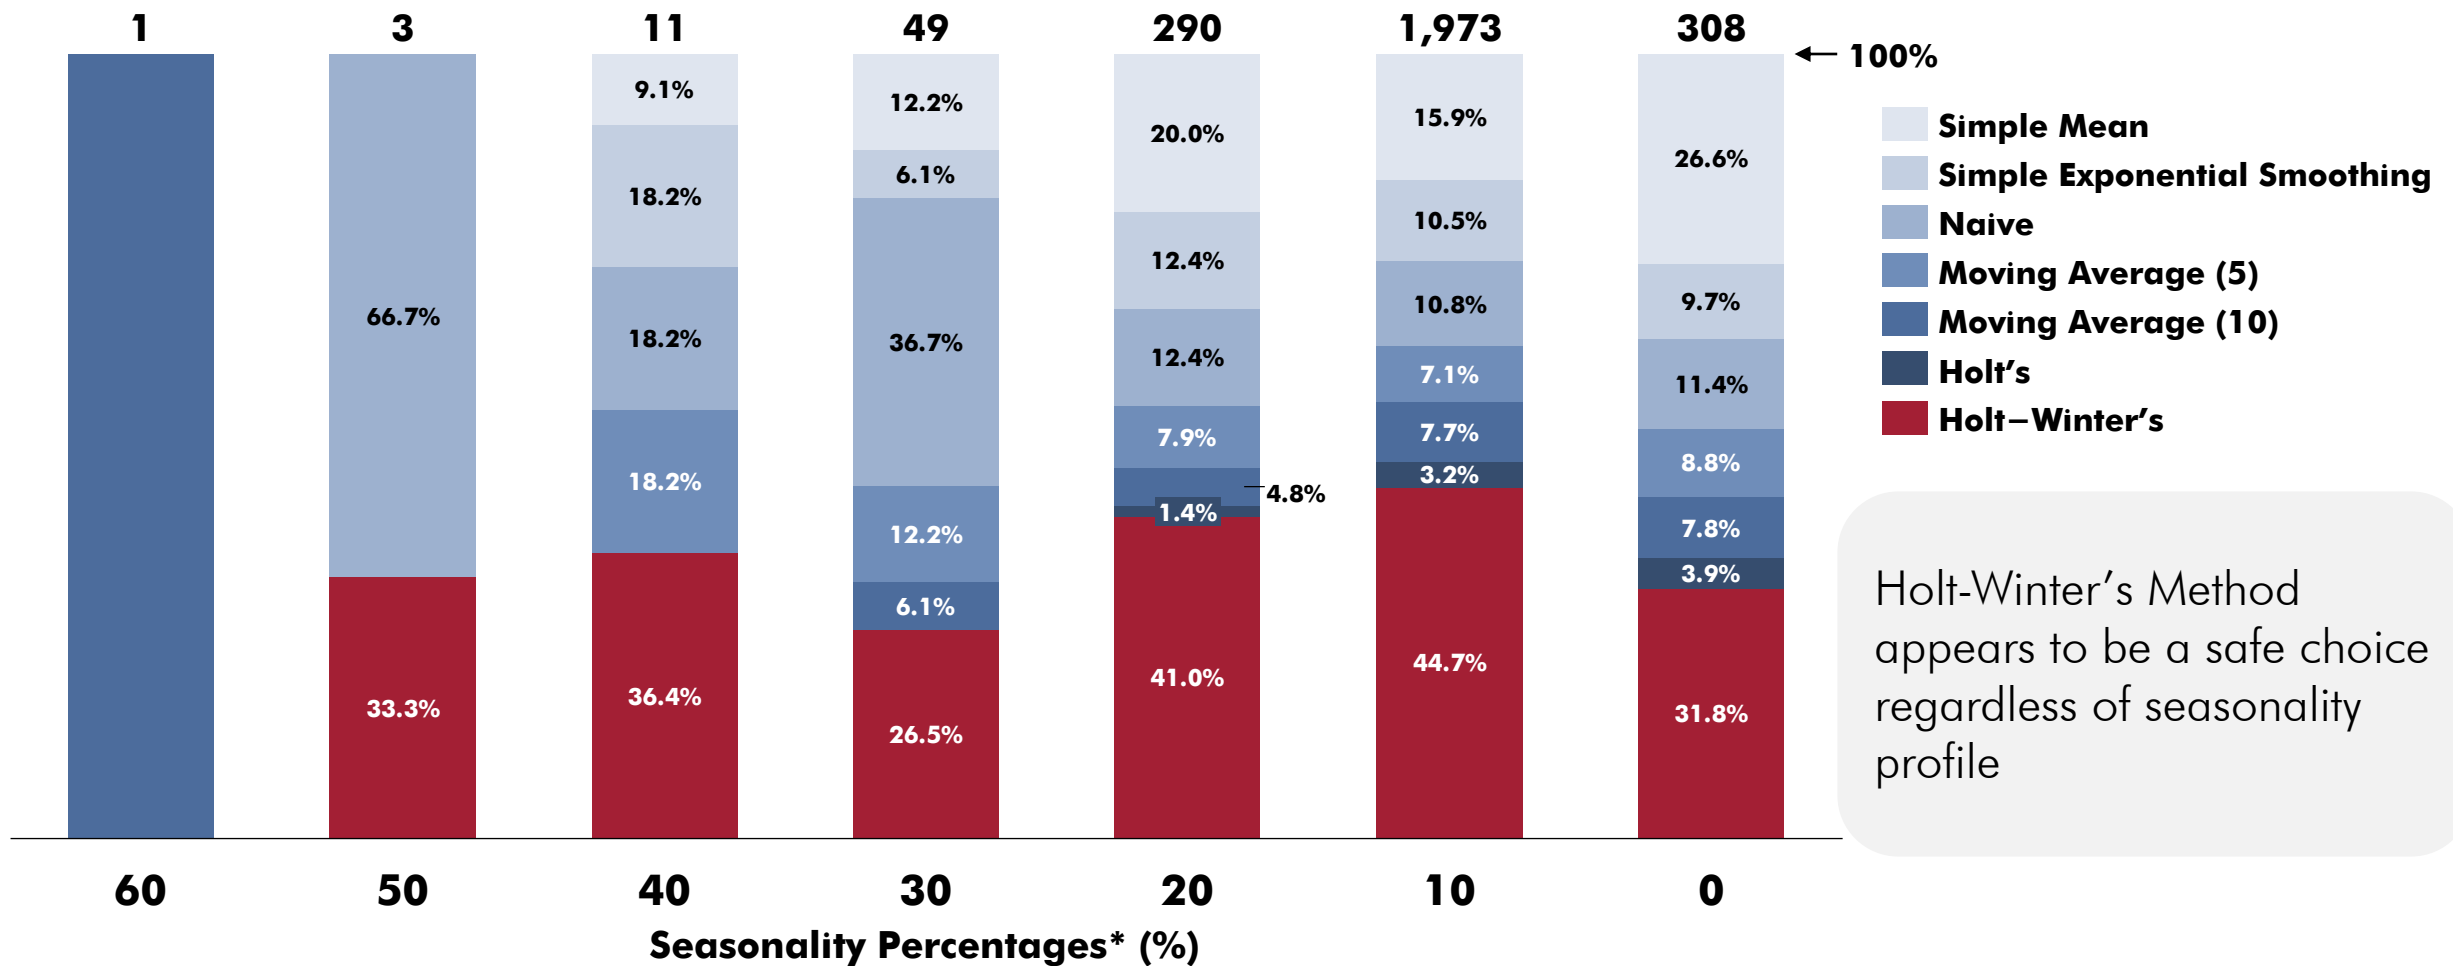

Holt–Winter’s Method appears to perform well regardless of the level of seasonality in the data

Background

Data

Analysis and Results

Conclusion

Holt-Winter’s Method appears to be a safe choice regardless of seasonality profile

Signs of 'Lane Profile'

Background

Data

Analysis and Results

Conclusion

Certain Lanes appear to favor certain forecasting methods

Cost of item appears to be a factor in how well they currently plan

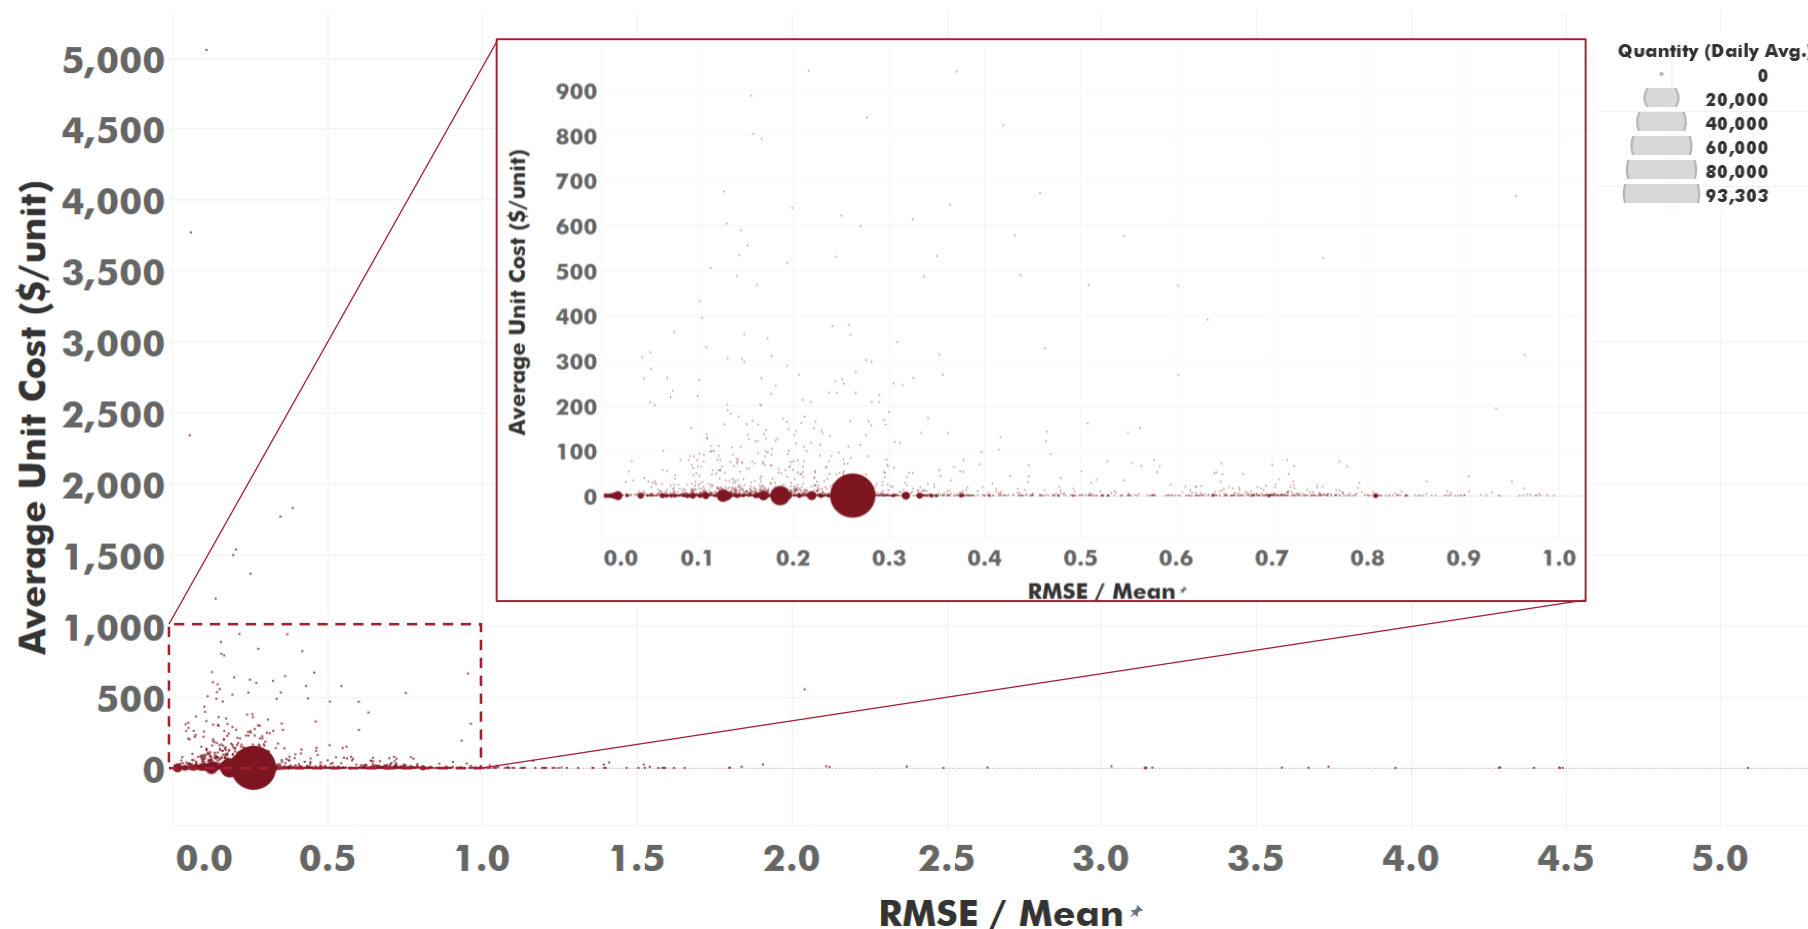

Background

Data

Analysis and Results

Conclusion

Cost vs RMSE

- Higher cost items have lower RMSE.
- Lower cost items have higher RMSE

Financial Implications

Background

Data

Analysis and Results

Conclusion

$$E[\text{safety stock cost}] = chk\sigma_{DL}$$

$$\sigma_{DL} = \sqrt{\mu_L\sigma_D^2 + \mu_D^2\sigma_L^2}$$

Notations:

c : unit cost (\$/unit)

h : holding rate (\$/\$ value/time). For this analysis, h is assumed to be 20%

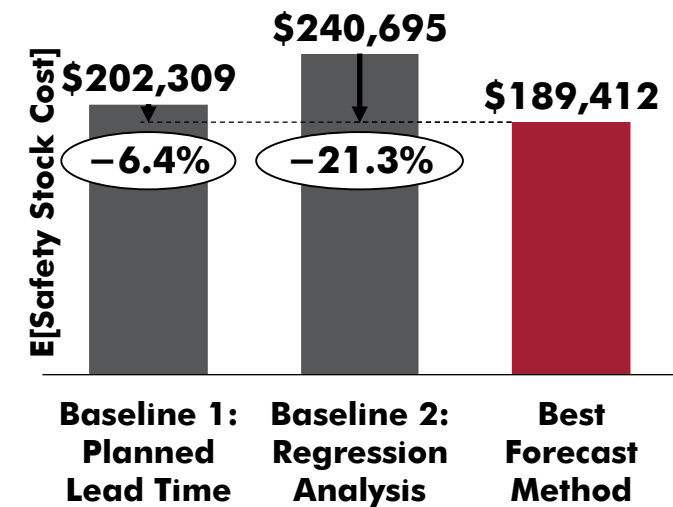

k : safety factor. For this analysis, service level is assumed to be 95%, thus $k = 1.645$

σ_{DL} : standard deviation of demand over lead time

σ_i : standard deviation of demand (D) or lead time (L)

μ_i : mean of demand (D) or lead time (L)

Estimated Safety Stock Costs

Potential cost savings by reduction in their safety stock

Bringing it together....

Today's Agenda

1**Background****2****Data****3****Analysis and Results****4****Conclusion**

Industry 4.0

Background

Data

Analysis and Results

Conclusion

1784 – Mechanization,
water power, steam
power

1870 – Mass production,
assembly line, electricity

1969 – Computer and
automation

Present – Cyber physical
systems / digital transformation

Important for 2 reasons:

1. Access to more data for analyses
2. Evolution of a “digital supply chain’s” role in planning

Digital Supply Chain

Background

Data

Analysis and Results

Conclusion

'Digital Copy' implies a level of detail in their similarity

Background

Data

Analysis and Results

Conclusion

≈

Supply Chain Planning Systems (e.g., ERP, APS) are becoming increasingly more complex in order to more accurately model the complexities of the physical supply chain

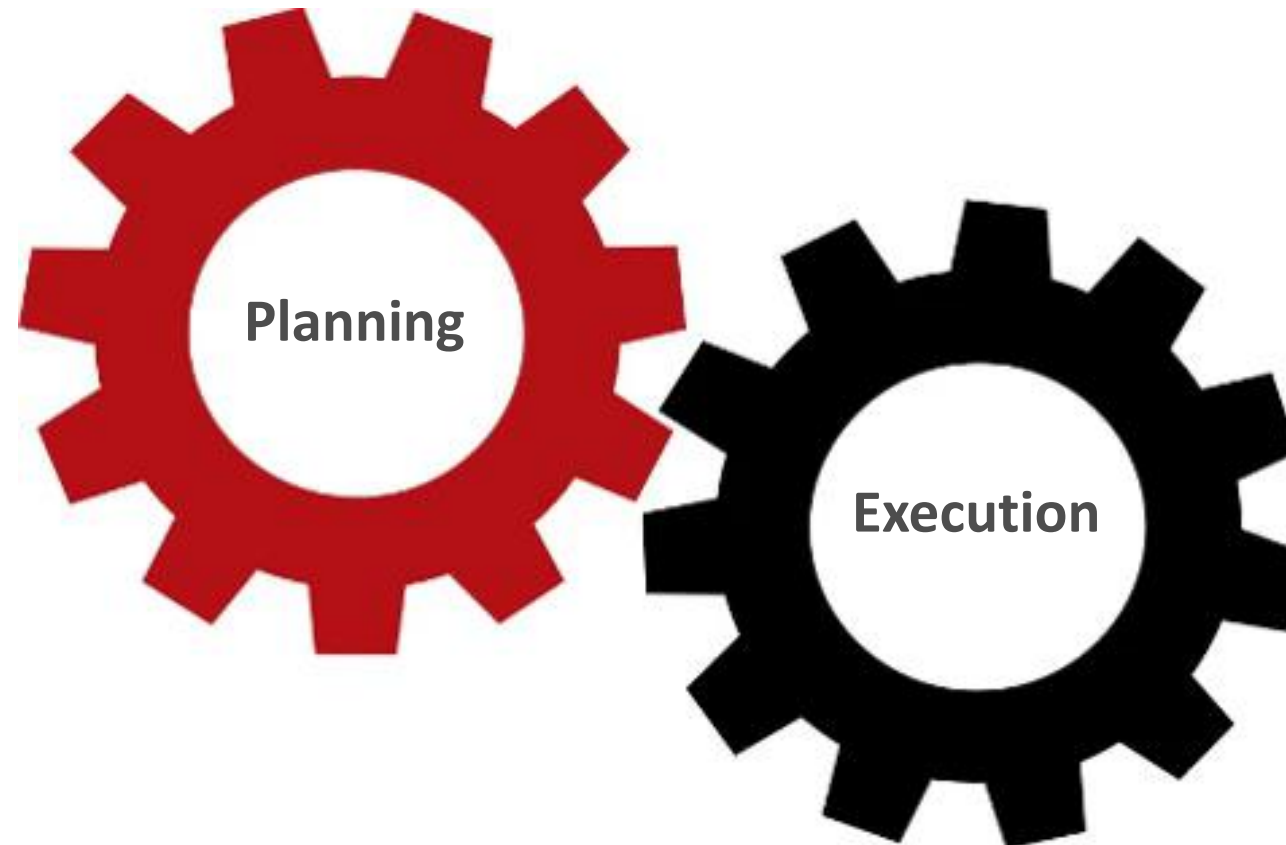

... because a plan that does not reflect reality will much manual intervention during execution

Background

Data

Analysis and Results

Conclusion

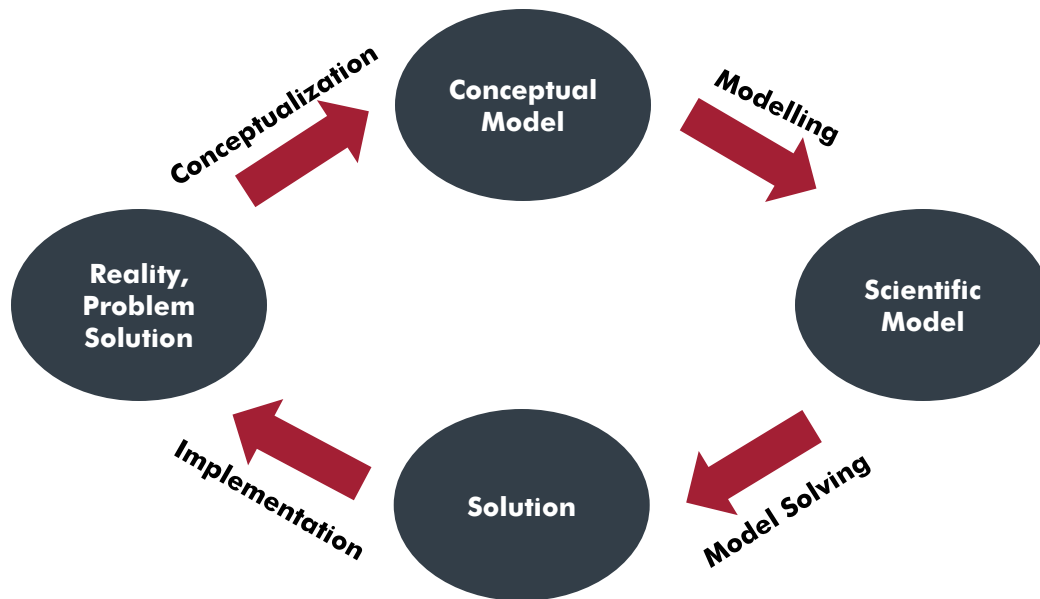

How abstract should we conceptualize the problem?

Background

Data

Analysis and Results

Conclusion

More abstract?

- Might solve the wrong problem
- Require more manual labor to supplement the decision making process

Errors of the Third Kind

Background

Data

Analysis and Results

Conclusion

Ian Mitroff

- First and Second Kind were about Accuracy – False Positive and False Negatives
- Third Kind (Mitroff, 1974) – Solving the wrong problem by choosing the wrong problem representation
 - Could be more problematic than first and second kind errors

Humans Making Decisions?

Background

Data

Analysis and Results

Conclusion

- Kahneman & Tversky, 1979
 - Prospect Theory – People make decisions based on potential value rather than the outcome
- Wu and Gonzalez, 1999
 - Further studies on Prospect Theory. Analyzed different probability weighting functions
- Schweitzer & Cachon, 2000
 - Managers consistently deviated from the optimal order point for newsvendor problem, even with feedback and additional training

Probability Weighting Function

To Summarize...

Background

Data

Analysis and Results

Conclusion

We need a planning process that is:

Data Driven

More Complex, More Like the Physical

Less Human Intervention
